ABSTRACT

This resource guide provides information on distance education options and offers a directory of programs at various institutions in the United States and Canada. Following a brief preface on the development of the guide, "New Models for Higher Education in Changing Times," by Don Doucette, discusses the nature of distance learning, the inevitability of this type of instructional delivery, the infrastructure provided by information technology, and changes required in the current model of higher education. Next, an introductory essay outlines the basics of distance education, explaining its role as an alternative to traditional classroom instruction and outlining the following forms of distance education: (1) print, including correspondence courses with textbooks, study guides, and assignments mailed to students; (2) audio, featuring radio, audiocassette, and telephone-based instruction; (3) video, including television, videocassette, and videodisc courses; and (4) computer-based approaches, featuring telecommunications, electronic mail, electronic conferencing, electronic bulletin boards, and telecommunications networks. Results of a survey of 1,000 community colleges are also included, indicating the top delivery media used and the most and least frequently offered courses. The bulk of the guide consists of a list of community college distance education programs by state or province. Each entry provides the college's name and address, the media used and disciplines taught in distance education, and the name of a contact person. Explanatory notes highlighting special features are included with some entries.

PREFACE

The national project on Computer-Based Distance Education is a joint effort by the League for Innovation in the Community College and Miami-Dade Community College, Homestead Campus. The initial goal of the project was the creation of a resource guide that would provide educators interested in alternative delivery systems with timely and relevant information. The following pages are the product of the efforts of my colleagues involved in distance education in the United States and Canada and those of us at the Homestead Campus of Miami-Dade Community College involved in Project Outreach, our campus' distance education initiative. This guide summarizes the information provided by the respondents to the project's survey. It is hoped that the publication of the names of those institutions involved in distance education, the professionals involved, and specifics about the many and varied distance education programs in place will be useful to anyone interested in beginning or exploring technology-intensive distance delivery systems.

The compilation of this guide coincided with the landfall of Hurricane Andrew in Homestead. The interruption of deadlines, schedules, and mail delivery caused by Andrew's brief, devastating visit may have contributed to the occasional errors and omissions in the body of this guide. To all of my colleagues who were so cooperative in communicating and responding to our questionnaires, our thanks and our apologies for any errors that may have occurred. After reviewing references to your institution, please let us know if corrections need to be made in subsequent editions.

For the most part, this guide's value is the direct result of the contributions of the distance education professionals in community colleges throughout North America. Yet I must acknowledge the tireless efforts of the two individuals charged with assisting me in the review, organization and compilation of the information so generously provided. First, special thanks and recognition to Petty Officer First Class Terri Curry, USN who was on an academic leave from the Navy and worked as my assistant on this project when not in class at Miami-Dade. And, when the Navy wanted Terri back, Billie Brown, an MDCC graduate and Homestead Campus Valedictorian in 1992, quickly and competently finished the task. For all of us who find this guide valuable, your efforts made it possible.

FOREWORD

New Models for Higher Education in Changing Times

Distance learning will inevitably become a major component of higher education. There is considerable resistance to this notion, especially from among the most traditional constituents of higher education, including faculty, students, and higher education leaders. Such resistance is understandably based upon an attachment to the current way of doing things. However, this resistance is, at least in part, also based upon a misunderstanding of the nature of distance learning.

The Distance Learning Model

Distance learning is, unfortunately, too often equated with telecourses, which, although they have been used to serve a limited constituency quite successfully, nonetheless, represent only a single dimension of what is possible with distance learning. Telecourses connote to many the passive delivery of information to students with little of the interaction and feedback that is assumed of classroom-based instruction. In many ways, the key components of distance learning are much better understood by reference to the earliest forms of the methodology-- correspondence courses offered in the nineteenth century which provided education to individuals in remote, generally rural, locations who would otherwise have been deprived of access.

While the delivery mechanisms have evolved considerably since the 1850s, the model for distance learning used by correspondence courses contained all of the elements of the modern model. Students who for various reasons could not be in a place at the time that live instruction took place were provided by mail with instructional materials, including content to be mastered and assignments with which to demonstrate mastery. Students interacted with their instructors by returning assignments that were then graded and commented upon, again by mail. The key elements of correspondence courses--the delivery of instructional experiences to placebound and timebound students with formal mechanisms for interaction between students and teachers--remain the basic components of modern distance learning.

The Inevitability of Distance Learning

Distance learning will inevitably become a major component of our system of higher education because of pressures now being placed on the system. First, demand for higher education and advanced training is increasing at a pace that is straining the system's ability to respond. The transformation of the workplace caused by information technology and the emergence of global economic competition has placed a premium on higher levels of education and training, which for most adults, will be met within the context of the nation's system of colleges and universities.

Computer-Based Distance Education in Community Colleges

Related to this increasing demand are the changing demographics of the consumers of higher education. Rather than focusing exclusively on the task of preparing 18-22 year olds for entry into the work force, increasingly the principal task of many institutions of higher education will become the education and training of the current work force, up to 75 percent of whom will require substantive retraining in this decade. These new consumers of higher education are overwhelmingly placebound and timebound adults who cannot interrupt established work and family lives in order to seek retraining. A distance learning alternative to classroom-based instruction is not just convenient for these learners, it is the only feasible option.

Distance learning also provides an alternative model in response to the greatest single pressure on the current system of higher education--rapidly increasing costs in an era of declining ability to pay. It has become evident that the current model for higher education is economically unsustainable. Operating costs and tuitions are increasing double and triple the rate of inflation at the same time that programs and services are being cut; students, in effect, are paying more for less. Yet, students and parents can no longer absorb the sharp increases in tuition that are required to fund the current model of higher education, and states can no longer afford to increase subsidies of their college and university systems.

Distance learning is one of the very few alternative models to classroom-based instruction that has the potential to increase productivity--to provide more learning for more students without corresponding increases in the number of faculty, staff, and administrators. Distance learning is inevitable because the model can not only be used effectively to meet increased demand for higher education and training, but it can also do so at reduced unit costs.

Information Technology Provides Infrastructure

The final development that has virtually assured the widespread adoption of the distance learning model is the successful application of information technology to instruction in higher education. After years of experimenting, it has become clear how technology can help serve students better. Three ways stand out as universal:

First, powerful, increasingly economical networks allow enhanced communications between students and faculty, students and students, and everyone and college resources. There are numerous examples of using electronic communications systems to increase productivity; there are more and more examples of using communications technology to build community and to deepen and broaden the content of intellectual discourse.

Second, related networking technologies can provide access to ever richer sources of information. As virtually all data, text, audio, and video now produced are digitized, these can be easily transmitted to any location, no matter how remote. Not only information, but tools, human expertise, and other resources can just as easily be shared, thus ensuring greater equality of access to resources to students in rural colleges as well as urban ones, to those from small communities as well as those living in great international centers, to

individuals working or studying in modest institutions as well as to those in wealthy colleges and communities. Information technology makes it possible for all students to have access to virtually whatever information they need for their academic and personal development.

The third, and perhaps the most important, way that technology can help serve students is by providing educational resources that are tailored to the diversity of learning styles, cultural differences, skill levels, motivations, and educational objectives of increasing pluralistic student bodies. Individualized instruction has been the goal of all good teaching for decades, but the fact is that traditional, classroom-based methods of delivering instruction make true individualization virtually impossible. However, new technologies, including interactive multimedia materials, learner-centered instructional management systems, and sophisticated independent learning systems, make real individualization within the reach of all students.

All three of these applications of information technology are tailor-made to support a distance learning model for higher education. In fact, the prospects for distance learning have never been better as advances in information technology can now overcome barriers to real interaction between distance learners and their instructors, as well as among distance learners themselves, that have plagued previous efforts.

Changes Required

There is little doubt the current model for higher education is that of the research university. Common perceptions of what constitutes "college" invariably include sequential study for young people delivered primarily face-to-face in classrooms, usually in residential institutions. The model for higher education among business and political leaders, students and parents, and even most educators, remains Harvard. However, at the heart of distance learning is movement out of the classroom, the use of alternatives to face-to-face instructions. Distance learning, then, requires a new educational model.

Providing education and training via distance learning will require reengineering of colleges and universities. Most critically, it will require redefinition of the role and work of faculty in order to make the most productive use of this precious resource. Coming down from their roles as "sage on the stage," faculty need to take on roles as developers of curricula, planners of educational experiences, and managers and facilitators of student learning. Far from being eclipsed in a distance learning model, faculty roles become more sophisticated and professionally rewarding.

However, also key to the movement toward distance learning is the transformation of the teaching and learning process to one that is student-centered. Perhaps the greatest contribution that distance learning may yet make to higher education is to transform the model from one based upon the "community of scholars" to one that identifies the development and sustenance of "communities of learners" as the primary objective. While not a new concept, widespread implementation of distance learning as a primary model for

higher education will have major effects on colleges and universities, forcing them to reinvent new ways of doing business.

Distance Learning in Community Colleges

This directory provides a very helpful review of the range of distance learning activities that are already being undertaken at community colleges. As such, this document is testimony to the resourcefulness of community colleges in applying a range of instructional delivery methodologies and various technologies to serve their students and communities. Because of their commitment to respond to the needs of their communities, community colleges are likely to be in the forefront in implementing new distance learning models, and the examples described in the following pages support this contention.

Judy Lever has done us a favor by collecting into one resource directory this wealth of information. It is hoped that at a minimum the guide will encourage the exchange of information, ideas, and resources among those who are involved in operating distance learning programs. However, the directory will have accomplished its ultimate purpose if it assists community colleges to help each other explore new ways to provide universal access to higher education and to develop better models with which to serve the needs of individuals and the nation and Canada.

Don Doucette
Associate Director
League for Innovation in the Community College

INTRODUCTION

For those individuals for whom distance education is new, a brief introduction to the basics is provided on the following pages. This introduction, condensed from a paper originally presented at the Florida IBM/ACIS conference in 1991, explores the various approaches used to provide instruction to remote locations. All distance education approaches that effectively provide for the learner's needs are appropriate. The best programs are those that use a variety of media and technologies in support of the teaching learning process. Each institution noted in this guide has developed its own approach or combination thereof. Taken together these constitute a spectrum of effective strategies from which those interested in beginning or expanding a distance education program can choose.

The Role of Distance Education

Distance education has existed as an alternative to traditional classroom instruction since the mid-1800s. These early distance courses used the postal system for the delivery of printed course work. The range of correspondence courses that grew out of this movement reached many Americans isolated in rural areas providing them with an access to education that would not have been available otherwise.

The structure of distance education courses evolved in accordance with the trends and changes in traditional education. As audio-visual aides were added to the traditional lecture approach, distance education incorporated audio-visual components as well. Radio broadcasts were initially used to add audio to distance instruction. Later, television broadcasts on public networks added a visual dimension to distance learning. Today, the delivery of instruction over distances is accomplished using the many technologies that enhance traditional education including satellite links, computers and interactive communication.

Distance education is a collection of innovative approaches to the delivery of the content of more traditional education. It is a process that uses a variety of technologies to overcome the separation of the teacher and the learner. Distance education takes the value and objectives of traditional courses and uses the technologies of the Information Age to address the needs of a broader and more complex educational market (Kelly, 1990). Distance education does require that educators creatively approach the individualization and organization of curriculum, but the content identified by the professional as worth teaching remains unaltered. Distance delivery of traditional education is an attempt by educators to free the learner from the constraints of time and place, and through this, improve access for more participants (Reed and Sork, 1990).

Approaches to Distance Education

Print:

The oldest approach to distance education is the correspondence-type course. This method uses the postal system to deliver courses in print. Textbooks, study guides and assignments are mailed to the student, work is completed and then returned for grading. After being graded by the instructor, the work is returned to the student via mail. The advantages of this method are the cost and flexibility of print materials. Not only are printed materials relatively inexpensive, educators have become skilled at creating educationally sound, independent study curriculum using this method. In addition, both the students and the institution can rely on the postal system for cost effective, accurate delivery.

The disadvantage of this method is its lack of depth as a teaching vehicle. Printed materials provide only one dimension to the subject matter. An additional disadvantage of print as a primary delivery is the lack of timely interactivity between teacher and student. Students must wait for feedback. Then, the interaction is one way and subsequent questions result in more delay.

A final disadvantage of print-only distance learning is that the learner, at a distance from teacher and peers, experiences learning in isolation. The lack of real-time interactivity with the ideas of the instructor and other learners tends to diminish the learning experience.

Audio:

Radio is used by institutions to deliver audio-based instruction. Verduin and Clark (1991) note that for areas with low literacy rates, it can be effective as a replacement for print. Radio is a reliable medium and is easily accessible to most audiences. As a teaching tool it has both advantages and disadvantages. Unlike print, it can be easily updated to reflect curriculum changes. Radio alone, like most audio-based instruction, is not as effective a teaching tool as it addresses the relatively small group of learners whose dominant learning style is audio.

Radio also suffers from its incapacity for flexibility and interactivity. The learner must work at the pace dictated by the radio broadcast. And unless two-way radio instruction is used, there is little opportunity for real-time interaction using this method.

The **audiocassette** adds a self-paced dimension to audio delivery. This medium is a low cost, easily accessed means for providing instruction in a learner-controlled environment. The student can manipulate the pace, location and time of instruction. Unlike radio, a lesson presented via audiocassette can be quite lengthy and varied in depth and breath. Curriculum presented via this medium can be organized into sections with discussion topics and review. The flexibility for both instructor and student make this low cost approach practical and viable.

A minor disadvantage of audiocassette delivery is the need for playback equipment. This disadvantage has been overcome to a large degree by the decline in the cost of cassette players. They are becoming as readily available as television and radio. And in those cases

in which individuals do not have access, public libraries often provide the use of cassette playback units to their patrons. Audiocassette delivery also suffers from the lack of interactive capability characteristic of many approaches.

The **telephone** is the audio delivery system that provides interactivity. The telephone is used by faculty to interact with students to discuss questions, give lectures or, if conference calling is used, hold group discussions.

Telephone delivery can be a single or multiple-learner delivery system. Instructors can leave prerecorded information for each student to access at their convenience or they can call each student individually. Using conference calling, the instructor can meet with the class as a group to promote discussion and broaden student perspectives. Using telephones, students can network with each other, thus reducing the isolation that too often accompanies distance learning.

A new twist to the use of the telephone in distance learning is the introduction of Voice Mail. V-mail is a computer-based technology that turns sound into digital data and stores it on a computer disk for later use. A v-mail system allows students to access and select specific prerecorded information relevant to them. V-mail also provides students with the opportunity to contact their instructors outside of the constraints of posted office hours.

The disadvantage to all telephone approaches is the limitation of the information that can be communicated via this medium. The telephone is best for information that is reasonably concise. It will serve well to issue an assignment but it would be difficult to discuss the assignment unless previously sent in print. Also, when interacting via a telephone, the caller must interact quickly, without time to prepare a response. In a distance education program, the learner may be intimidated by the occasional but significant telephone contact.

Video:

Television, both broadcast and cable, has been an effective combination video and audio distance education medium. Using the national network of PBS stations and/or participating cable systems, video and audio instruction can be received by individuals or groups at remote locations. Additionally, microwave transmission of video signals provides access to non-wired viewing sites. Microwave broadcasting can provide local areas with video instruction that may not find a place in the PBS lineup. Microwave is particularly useful for transmission of video from point to point to relay TV signals for rebroadcast or into closed circuit systems. When applied to distance learning, television broadcast, regardless of the method, provides a better approximation of real-life instruction. Unfortunately, such broadcasts do not provide the opportunities for interactivity characteristic of the live classroom.

Video conferencing partially addresses this problem. Video conferencing requires that both the transmitting and receiving site be set up with monitors and video cameras. Each site can thus view and hear the interaction at the other site or sites. The constant presence of both video and audio from all locations enhances the learning environment (Hannu, 1990).

Computer-Based Distance Education in Community Colleges

From a distance education perspective, full video conferencing is highly desirable as a delivery mode. Courses are taught in a manner as close to live instruction as possible. However, while simulation of traditional instruction is achieved, a disadvantage of video conferencing is the constraint of location and time typical of traditional instruction.

Videocassettes have added another dimension to the use of television in distance education. This packaged version of televised courses (telecourses) answers the need for flexibility in times and location of presentation, but loses the interactive advantage of video conferencing. In addition, videocassette playback units are required equipment if the learner is to take instruction from this medium. Even with these disadvantages, videocassettes provide distance education with a low cost, simple medium for combining video and audio into a single distribution package.

Videodiscs provide a new packaging for video/audio instruction. Videodiscs, like their music equivalents, compact discs, are easy to use and very durable. Videodisc technology also provides more opportunity, through the use of custom programs by educators, to create highly interactive instruction individualized to suit the learner. For distance education, however, interactive video's primary drawback is the cost and number of videodisc players available at this time. Most homes and businesses have telephones, televisions and even videocassette players. Few have videodisc players. Until this changes or until computer technology provides alternatives for accessing videodisc from remote locations, this technology will be incorporated into the distance education scenario at a slower pace.

Computer-Based Approaches:

The application of personal computers to distance education can be used to promote interactivity when used with most distance delivery approaches. Using a modem and a phone line, computers at remote locations can connect to a "host" computer. All learners connected via their computers can then interact with each other and with the host. A distance learner using the keyboard or mouse can thus add real-time interaction with "on-line" instructors and/or other learners to the distance experiences. Such computer-based interaction via the phone lines falls into the broad category of telecommunications.

Telecommunications can overcome the consistent problem of limited interaction with instructor and peers. Regardless of the approach or combination of approaches used by a distance education program, participants may feel a sense of isolation and lack of opportunity for communication that students in traditional classrooms do not experience. These negative perceptions may serve to inhibit and impair the learning process. Computers provide several possible remedies via telecommunications.

Electronic mail, like voice mail, allows users to leave or receive messages from the instructor or peers. One-to-one communications are stored in personal electronic mail boxes until it is convenient for them to be "picked up" and "read". The advantage of e-mail over voice-mail is the ease of transmitting documents. In a distance education program that

utilizes e-mail, communications between learners and instructors is essentially instantaneous while maintaining convenience in terms of time and location.

Using **electronic conferencing**, a learner in physical isolation can connect via computer to one or more of his peers simultaneously. Together, this group can enter into a cooperative learning process, enhance their instructional experience and thus reduce the feelings of isolation. The teacher can create or join discussion groups or even hold the electronic equivalent of a traditional class.

Electronic bulletin boards provide a one-to-many communications platform. Assignments and course information can be posted, updated and retrieved at a time convenient to the user. In a distance education program, learners can access relevant college or course information any time a question arises. And if the specific information sought is unavailable, an electronic question can be left on the board.

Telecommunications networks combine many of the preceding facilities into a single broad electronic service. Electronic mail facilities can be linked to other host computer facilities so that a user in one system can leave mail for a user in another system. Learners and instructors with access to telecommunications networks can interact with peers in other universities and/or other countries. Other telecommunications networks allow learners to access on-line services such as electronic library catalogs, national data bases and abstracting services (Johnson and Carr, 1991). Learners using a computer and modem can access resources far beyond what might have been available on the home campus. Academic isolation by virtue of location is reduced if not entirely removed through the use of this type of network. The distance education experience takes on an added dimension.

The disadvantages to computer-based approaches has been the cost of the equipment and its accessibility to learners at remote locations. This situation is changing. For most institutions, computer equipment is no longer a rarity on campus. The Information Age has demanded an investment in technology and institutions have responded. Costs continue to fall thus increasing availability of equipment for distance delivery. For the learner, however, the cost and access to a computer remains a barrier to computer-based distance education. However, with the growing number of computers in homes and offices, this barrier may well be temporary.

An Integrated Distance Learning System

Distance education provides instruction to learners at remote locations using a variety of technologies and approaches. Each approach addresses the learner's needs but from a number of different perspectives. Each technology has associated with it specific costs in terms of equipment and the expertise required to use it effectively. Institutions must weigh the approaches and the technologies that support them when designing a distance education program. A balance must be found between the benefits and costs of the possible approaches.

Computer-Based Distance Education in Community Colleges

For every distance education program, the goal must be to deliver effective instruction using whatever is necessary and possible to accomplish the task. With this orientation, programs must focus on three objectives. First, to create a program that will provide increased access unrestricted by location and time. Second, to build a program that does not isolate the learner from the benefits of interactivity with instructor and peers. Finally, to use as many diverse deliveries as possible to meet the learning styles and needs of the target audience.

Current Distance Education Practices in Community Colleges

The Computer-Based Distance Education in Community Colleges project is an effort to promote and recognize community college distance education initiatives. The first phase of the project was the creation of this guide as a resource for those interested in distance education. A questionnaire was sent to over 1000 community colleges in North America. More than 700 responded.

The subsequent pages of this guide provide an annotated directory of those institutions that responded affirmatively to the survey and that are currently providing instruction to students at remote sites. The references include the institution's name, address, contact person, and phone/fax numbers. The references also include an abbreviated listing of the delivery approaches that the institution uses and subject areas presented via distance education. Annotations after some of the entries were submitted by those institutions as further clarification of their programs. The references are organized alphabetically by state and further by the name of the institution. A cross referenced index alphabetized by institution's name can be found at the end of the guide. The following abbreviations are used throughout this guide.

Subject Area Key

AC	Accounting	HL	Health
BH	Behavioral Science	HM	Humanities
BS	Business	JN	Journalism
CC	Child Care	MT	Mathematics
CJ	Criminal Justice	NS	Nursing
CM	Computer Science	PE	Physical Education
ED	Education	SC	Science
EN	English	SK	Basic Skills
FL	Foreign Language	SS	Social Science
FA	Fire Science	VC	Vocational Education

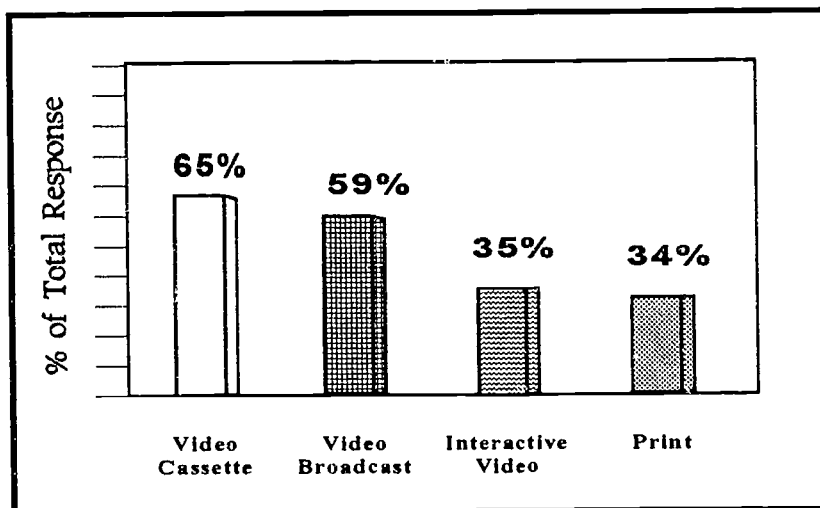

Media Key

AC	Audio Cassette	BB	Bulletin Boards
CB	Cable Broadcast	CC	Computer Conferencing
EM	Electronic Mail	IV	Interactive Video
PC	Phone Conferencing	PR	Print
RD	Radio Broadcast	VB	Video Broadcast
VC	Video Cassette	VM	Voice Mail

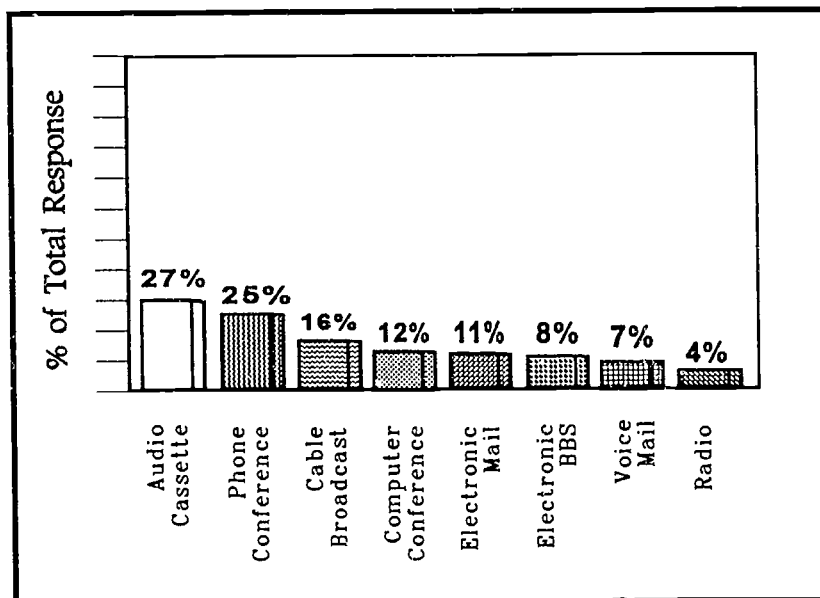

In the preparation of this guide, the data collected from this project's questionnaires were entered into an electronic database. The electronic data include all of the information found on the following pages in a .DBF file format. It also includes a data base of respondents to the survey who indicated that they are not currently engaged in distance education programs. Copies of the electronic data base and additional copies of this guide can be obtained by completing the request form at the end of this guide and returning it with payment to the address indicated on the form.

The initial analysis of the data is summarized in the following graphs. Of the 1280 surveys sent, 698 institutions responded. Of those, 313 indicated that they currently have a distance education program in place. The charts included herein indicate percentage of responses with reference to the types of delivery methods used and the courses taught via distance education. Further analysis of the data gathered will be published as it is completed.
